

DEPTHORATOR

125A - User Manual

Each repeat goes deeper.

Depthorator combines delay, high-quality algorithmic reverb and generation-aware depth progression: every successive repeat can move farther back into the virtual space.

1. Concept

A conventional delay mainly makes successive repeats quieter. Depthorator also changes their spatial perception. As generations progress, repeats can become darker, more diffuse, more reverberant and less direct. DEPTH controls the strength of this front-to-back progression. SIZE and DECAY are independent.

2. Controls

Control	Function
TIME	Delay time. Musical note values in SYNC mode; 20 to 2000 ms in FREE mode.
FEEDBACK	Controls the amount and persistence of delay repeats.
DEPTH	Determines how strongly successive repeats move deeper into the space.
CURVE	Shapes the progression of the depth movement.
SIZE	Controls perceived room size independently of DECAY.
DECAY	Controls the internal algorithmic reverb decay time, approximately 0.3 to 12 s.
DAMPING	Controls high-frequency damping. Higher values create a darker, softer space.
WIDTH	Controls wet-signal stereo width: 0% = mono, 100% = normal stereo width.
DUCK	Reduces the processed signal around transients and lets delay/reverb bloom afterwards.
MIX	Equal-power dry/wet balance.
FREE / SYNC	Switches TIME between free timing and tempo-synchronised note values.
MONO / STEREO / PING-PONG	Selects the delay/stereo routing mode.

3. Quick Start

Subtle depth: Set TIME and FEEDBACK to suit the track, keep MIX moderate and slowly increase DEPTH. CURVE determines how quickly repeats recede.

Melodic techno pluck: Enable SYNC, choose a rhythmic TIME value, create several repeats with FEEDBACK, raise DEPTH and shape the space with SIZE/DECAY. DUCK keeps the attack forward.

4. DEPTH and CURVE

DEPTH is not another wet control. Early repeats remain comparatively forward; later generations become increasingly embedded in the room. CURVE changes the shape of that progression.

5. Delay Modes

MONO keeps repeats focused. STEREO provides a broad stereo image. PING-PONG alternates repeats left and right.

6. Mixing Notes

At high DEPTH settings, increasing darkness in later repeats is intentional. DUCK helps preserve clear transients.

7. GUI and Scaling

The final interface provides a visible zoom selector for **100% and 150%**. The selected zoom level is stored with the plug-in state.

8. Installation

Copy the complete **Depthorator.vst3** folder to **C:\Program Files\Common Files\VST3**, restart the DAW and rescan if necessary.

9. Version / Status

Version 1.0.0 - final Windows x64 release.
